CP-04 · MAINFRAME KNOWLEDGE RECOVERY

Deterministic parsing gates the agent

Structural parsing and the reachability graph run first, entirely without an LLM. The extraction agent only ever sees paragraphs the parser has already proven reachable from `0000-MAIN` — so the two dead paragraphs in ACCTMSTR are excluded by construction, not by an instruction the model has to remember.

Left path is the deliverable judges see: cited rules become a lineage answer, a Confluence-ready wiki page, and a contradiction report against the three existing pages. Right path is the honesty check: the same `rules.json` and `coverage.json` run through `score.py` against SME-validated ground truth, which is the only place dead-code leakage or a missed citation actually gets caught.

— deterministic, real code — no LLM ▭ agentic step — needs ANTHROPIC_API_KEY

--- excluded on purpose — dead code, never reaches the agent
